

Philo - Feature #119

UUID woes

03/16/2011 01:41 PM - Harris Lapiroff

Target version:			
Description			
If UUIDs are to be req'd, they should not be hidden under the "Advanced" pane. But I think I'd sooner have them not be req's and autogenerated when they're not present.			

Associated revisions

Revision cd3e03ef - 03/30/2011 07:06 PM - Stephen Burrows

Made uuid of event autogenerated. Fully resolves issue #119. Also had to reset julian migrations again.

Revision a917b5dd - 04/06/2011 10:15 PM - Joseph Spiros

Merge branch 'master' of git://github.com/melinath/philo

- 'master' of git://github.com/melinath/philo: (31 commits)
 - Improved TemplateValidator error reporting to include origins and line numbers in TemplateSyntaxError reports.
 - Resolves issue 68 by treating any incorrectly-passed-in values for JSON fields as json strings rather than as python objects.
 - Resolved issue #120 by removing detection of containers which would not be rendered.
 - Made uuid of event autogenerated. Fully resolves issue #119. Also had to reset julian migrations again.
 - Julian improvements: Made calendar events optional and made calendar feed uuids auto-generated. Reset the migrations because south wasn't cooperating.
 - Adjusted 14082 hack again... "fixed" the ModelFormMetaclass.__new__ method and wrote EntityFormMetaclass as if there was no issue.
 - Moved the EventQuerySet to its own class instead of nesting it in the Event model.
 - Removed python 2.4 compatibility workaround use, since this is removed in Django 1.3 and philo doesn't support python 2.4 anyway.
 - Resolves issue #71 for the admin interface by working around the use of modelform_factory. If any code uses modelform_factory elsewhere with an entity form, the same issue will arise. Also compatible with 1.2.X.
 - Improved proxy-field hiding to be 1.3-proof. Unfortunately, requires a attribute on the proxy admin, but it seems like the best way. Still backwards-compatible with 1.2.X.
 - Removed shpherd navigation_host filter exception reraising. Tweaked LazyNode - turns out the / needs to be prepended **before** trying to check if the node handles_subpath.
 - Added some convenient methods to event querysets.
 - Switched Template.__unicode__ to only return self.name for legibility.
 - Corrected node_view redirection of trailing slashes to non-trailing slashes to rely on request._cached_node_path instead of request.path.
 - Tweaked LazyNode to only return a found node if it handles the found subpath.
 - Added feed_length to BlogViewAdmin.
 - Solidified AJAX API.
 - Prettified results page. Added search results templates for grappelli and the normal admin.
 - Refactored weight code to split the work over Search, ResultURL, and Click models. This is probably somewhat less efficient, but it makes more intuitive sense. It also allows for weight caching on instances. Initial work on a results action/view for the SearchAdmin. Set SearchView to have SearchForm set as an attribute on itself rather than blindly using it.
 - First attempts at a get_favored_results method to find what people are generally selecting. Some minor aesthetic changes. Changed ajax api template fetch to call get_template with the intent of passing an argument as to whether it should be prepped for ajax.
 - Updated CalendarView urlpatterns to use the new feed_patterns method.

History

#1 - 03/16/2011 02:06 PM - Harris Lapiroff

- File Screen_shot_2011-03-16_at_10.06.35_AM.png added

Ditto for the UUID field on calendars as well as events.

#2 - 03/30/2011 07:07 PM - Stephen Burrows

- Status changed from New to Resolved

Resolved with commit cd3e03e.
